1. What is cryptocurrency?

A cryptocurrency is digital money secured by cryptography and recorded on a public ledger called a blockchain. No bank or government runs the ledger - thousands of computers (nodes) verify and store every transaction.

Key ideas:

- Coins (Bitcoin, Ether) are the native currency of a blockchain.
- Tokens (USDT, LINK) are built on top of another blockchain.
- A wallet does not hold coins; it holds the private keys that prove you own coins recorded on the blockchain.

2. Reading the market

Price: what one coin costs right now. Market cap = price x circulating supply. 24h volume: how much was traded in the last day - high volume means easier buying and selling.

Risk basics:

- Crypto is volatile: 10% daily moves are normal.
- Never invest money you cannot afford to lose.
- Spread risk across several assets instead of one.
- Predictions (including this app's AI) are not investment advice.

3. Using a wallet safely

- Install wallets (e.g. MetaMask) only from the official site or app store.
- Write your recovery phrase on paper. Never type it into a website, never share it, never screenshot it.
- Connecting a wallet to an app only shares your PUBLIC address. A genuine app never needs your recovery phrase or private key.
- Double-check every address before sending - transactions cannot be undone.
